

Kyan Pascal Error \$89 (137)<#>

DOS ERROR \$89

A few people, while compiling their Kyan Pascal programs, have come across an error message that reads:

```
pc: DOS error on file: D1:filename.p
89 - Error code
```

This matches the DOS 2.5 error 89 (truncated) and happens when there are more than 256 characters including EOL on one line. So, if your source code e. g. has a large comment section, it should be broken into smaller groups. This is not a bug; it is just the way the Atari 8-bit computer works. Its I/O is limited to a record length of 256 bytes.
